

# IoT made real

Identify and control the hidden inefficiencies in your operations

## Why IoT is the solution for your business

IoT products enable to sense and capture unstructure information of any work enviroment, and convert that into data. That data then becomes available to you so you can access analytics, discover patterns and insight and improve those processes that have long been an issue to your operation performance. The power of IoT is that you can transform various processes making them work intelligently.

## IoT end-to-end stack makes it possible

Start by identifying the inefficiencies in your operations. Those simple issues that you need to focus on solving to make your operation more profitable and efficient.

Use simple sensors and controlllers with no expensive setup (stick and play) to start measuring what you need to control. You can choose among motion sensors, temperature sensors, humidity sensors, among others.

Our multi-protocol central hub will gather all the information and consolidated into one dashboard that you will be able to customize without need of specialized technical expertise or coding. Setup your own functions, alerts, anomaly detection and access historical data.

Create your own Applications to manage and control the devices daily. The application will allow you to track and monitor functions in real time and alert you when anomalies are detected.

# Efficiency gaps in the food industry

Even if your business is thriving, you likely experience some of this really typical pain points in the industry that prevent your operations from being much more efficient.

Our easy to implement end-to-end IoT stack helps quickly, and with minimum investment, fix some of the most griped-about food industry issues.

## Real-time refrigerator status

Being able to know with precision when there is a major change in temperature or humidity can make all the difference between losing money on wasted food or just quickly fixing the issue.

We place a stick and play sensor in your unit that connects to our software so you start receiving alerts instantly. Access historical data to identify patterns and any other possible hidden inefficiencies.

## Energy consumption measuring

Learn exactly where consumption is going and where there's room for savings.

By simple connecting our smart sensors, you can access detailed information about energy usage as well as historical data for better analysis.

Setup instant alerts to detect any anomalies in usage.

## Lighting control

Webee offers the right control solution no matter what type of lighting system you have installed, incandescent, fluorescent, LED, we manage them intelligently to enhance control and ensure efficient usage as well as automated functions.

## Self programming and alert notification

### Something is wrong in the operation?

Our System will trigger instant notifications so you can take action immediately. The anomaly detection will alert you of any change on patterns instantly.

### The best part?

This is a DIY system that can be programmed, modified or updated by you without calling specialized service to do so.
